

Artificial Intelligence

Changes Introduced

Areas

- Employment.
- Business.
- Startups.
- Society.

Notes

- The world's leading consulting firms have analyzed the impact AI will have on employment, businesses, startups, and society. These forecasts are not an exact science, but it seems reasonable to consider them to prepare for what's coming.
- Next, we will see a brief summary of the changes by areas. In the following sections, we will do a more detailed analysis of each of them.

Employment

- Mainly, AI is going to change the way we work. Just like what happened with the Internet or mobile phones.
 - Using AI will improve employee productivity: we will be able to do more things in less time.
- AI will not have a significant impact on 30% of jobs.
- Like the Internet, AI will eliminate some jobs. Initially, this figure will be less than 10%, but some experts like Elon Musk or Ilya Sutskever (OpenAI) estimate that AI could eventually make almost all jobs unnecessary.

Business

- Like the Internet or mobile phones, companies will adopt AI as a work tool in multiple areas.
- Adopting AI will become a competitive weapon that can alter a company's position in its sector. Companies that adopt AI more quickly and intelligently can outperform those that resist change.
- Some companies will disappear as a result of AI.

Startups

- The new AI will create as many or more startups as the Internet and mobile technology.
- Business Angels and venture capital investors in the most innovative areas of the world are already confirming this perception.
- It is still very early for AI startups. The technology is still very young (orchestration frameworks) and in some respects expensive (GPUs) and unstable (foundational models).

Society

- As happened with the Internet and mobile technologies, the new AI will change the way we live, inform ourselves, learn, communicate, shop, spend our leisure time, etc.
- As happened with the Internet and mobile technologies, the new AI will become a tool of mass use.
- As happened with the Internet and mobile technologies, the new AI will bring new ethical and legal problems.
