

# Hierarchical Clustering

BY MG ANALYTICS

# Agglomerative clustering

- ▶ It creates a hierarchy of clusters, and presents the hierarchy in a dendrogram.
- ▶ This method does not require the number of clusters to be specified at the beginning.
- ▶ Distance connectivity between observations is the measure.
- ▶ This is a bottom-up approach.
- ▶ Each observation starts in its own cluster.
- ▶ the similarity (or the distance) between each cluster is computed and then we merge the two most similar ones at each iteration until there is only one cluster left.

- ▶ A tree that shows how clusters are merged/split hierarchically
- ▶ Each node on the tree is a cluster
- ▶ Each leaf node is a singleton cluster

`dist(iris[, 1:4], method = "euclidean")`

- ▶ Computationally heavy.
- ▶ Suitable for smaller data set.
- ▶ Gives same clusters every time.
- ▶ No need to provide number of clusters at the beginning
- ▶ Difficulty handling different sized clusters and irregular shapes.
