

Equality and Inequality Operators Exercises

- What is the prototype of the equality operator?
- How is it invoked?
- How is it called?

- What is the prototype of the inequality operator?
- How is it invoked?
- How is it called?

- Why are these operators implemented as member functions?
- Why do these operators take their argument by reference to const?

- Explain what this code does

```
return !(*this == other);
```
